

## 7 Principles of Universal Design

We could add a GUI to our program to improve its Simple and Intuitive Use and Equitable Use. A GUI would make the menu options less tedious to go through and large menu buttons will make the program more accessible to those who suffer from poor vision. A GUI would also improve Flexibility in Use as a keyboard and ability to type will not be required. We could also add audio descriptions of each menu options and actions performed to improve the Equitable Use of our program as it will make the program more accessible to people suffering from blindness.
